Buzzards Bay

National Estuary
Program

Condensed by:
Buzzards Bay National Estuary Program
May 2006

Key

- OBL Obligate Wetland - Plant has a >99% occurrence in wetlands.
- FACW Facultative Wetland - Plant has a 67% to 99% occurrence in wetlands.
- FAC Facultative - Plant has a 34% to 67% occurrence in wetlands.
- FACU Facultative Upland - Plant has a 1% to 33% occurrence in wetlands.
- UPL Obligate Upland - Plant occurs <1% in wetlands in this region but occurs in wetlands in other regions.
- NA No agreement - No agreement was reached by the regional Interagency Review panel.
- NI No indicator - Insufficient information is available to determine an indicator status.
- NO Not Occur - Species does not occur in the region.
- * Tentative assignment based on limited information
- + Plant is in the higher portion ("wetter") of the indicator frequency.
- Plant is in the lower portion ("drier") of the indicator frequency.

Indicator Status	Wetland Indicator	WSI Value
OBL	yes	1.00
FACW+	yes	.94
FACW	yes	.83
FACW-	yes	.72
FAC+	yes	.61
FAC	yes	.50
FAC-	no*	.39
FACU+	no*	.28
FACU	no*	.17
FACU-	no*	.06
UPL	no*	.00

*Individual plants in these indicator groups may have developed morphological adaptations for hydric conditions. These individual plants are considered wetland indicators.

NOTES on:

Nyssa sylvatica, Marsh.*cont*

Swamp tupelo not only tolerates flooding but actually thrives under those conditions (16). It is seldom found on sites that are not inundated much of the growing season. Swamp tupelo grows in headwater swamps, strands, ponds, river bottoms, bays, estuaries, and low coves. Normally it does not grow in the deeper parts of swamps or overflow river bottoms.

The type of water regime is more important to growth of swamp tupelo than the soil type (11). Best growth is achieved on sites where the soil is continuously saturated with very shallow moving water. Growth can be reduced as much as 50 percent when the water is stagnant, as in ponds. Intermittent flooding, with periodic drying cycles, or continuous deep flooding even by moving water, also reduces growth.

Associated Forest Cover Swamp tupelo is a major component of the" forest cover types Baldcypress-Tupelo (Society of American Foresters Type 102), Water Tupelo-Swamp Tupelo (Type 103), and Sweetbay-Swamp Tupelo-Redbay (Type 104) (9).

NOTES on

Nyssa sylvatica, Marsh. From:

http://www.na.fs.fed.us/spfo/pubs/silvics_manual/Volume_2/nyssa/sylvatica.htm

Black tupelo (*Nyssa sylvatica*) is divided into two commonly recognized varieties, typical black tupelo (var. *sylvatica*) and swamp tupelo (var. *biflora*). They are usually identifiable by their differences in habitats: black tupelo on light-textured soils of uplands and stream bottoms, swamp tupelo on heavy organic or clay soils of wet bottom lands. They do intermingle in some Coastal Plain areas and in those cases are hard to differentiate.

BLACK TUPELO Black tupelo (*Nyssa sylvatica* var. *sylvatica*) is also widely known as blackgum; other common names include sourgum, pepperidge, tupelo, and tupelo gum.

Native Range Black tupelo grows in the uplands and in alluvial stream bottoms from southwestern Maine to New York, to extreme southern Ontario, central Michigan, Illinois, and central Missouri, and south to eastern Oklahoma, eastern Texas, and southern Florida. It is local in central and southern Mexico. Optimum development is made on lower slopes and terraces in the Southeastern United States.

Associated Forest Cover In New England it is associated with Black Ash-American Elm-Red Maple (Society of American Foresters Type 39).

SWAMP TUPELO Swamp tupelo (*Nyssa sylvatica* var. *biflora*) is also called blackgum; another common name is swamp blackgum.

Native Range Swamp tupelo grows chiefly in the Coastal Plains from Delaware, eastern Maryland, and southeastern Virginia, south to southern Florida and west to eastern Texas. Its range extends north up the Mississippi Valley to southern Arkansas and west and south Tennessee (17).

Soils and -Topography Swamp tupelo grows on a variety of wet bottomland soils including organic mucks, heavy clays, and wet sands. It occurs mainly on soils in the orders Ultisols, Inceptisols, and Entisols.
